

My model

Introduction

my model is based around the judas which occurs at New York open price

- > this is the primary element in most of my setups
- although this is not the only component

Contracts:

- > NQ [nasdaq]
- > ES [s&p500]
- > CL [usoil]

Draw on liquidity

this is always my first component, where is price moving, this should be your first objective, locate the level you're expecting price to move towards

Open price

our opening price is 09:30
> utc-4

pre opening, we're looking for price to engineer liquidity in the opposing direction to the draw on liquidity

First components

once you have developed draw on liquidity and can identify price engineering liquidity pre-open we can expect manipulation

- manipulation is a "temporary move against the main trend"

this is the reason it's called a Judas swing, following this move we can expect displacement towards the draw.

Entry function

- > once you have
 - identified draw on liquidity
 - manipulation at open price
 - price shifts towards dol

we can look for entries at the breaker block, especially when a fvg is aligned

a move in the opposing direction to the draw

- > a temporary move against the main trend

The Unicorn model

Time - this is the first variable
our price open is 09:30am.

at this time we expect to see manipulation.
Price moves in the opposing direction that we expect it to move.

Bullish → expect move down first
Bearish → expect move up first

three components

- original consolidation
- manipulation at → open
- breaker + fvg

1.original consolidation

this is the most important of the 3, before session starts we must identify the draw where price is moving and why

relating closely to time is news.
(It's important we check these before each session)

In the event:

08:30 AM news we wait for 09:30 AM
10:00 AM news we wait until after

2.manipulation

this is where we look for liquidity to be manufactured and taken at 09:30 AM

Bullish → Look for a move down first.
Bearish → Look for a move up first.

3.Breaker + fvg

this is simple, we want displacement through a breaker towards the draw

Draw on liquidity

- Micheal J. Huddleston

draw on liquidity

> this is always our first component, without this we have no framework, no expectation from price

"smooth edges are made ridged, these are the best draw on liquidity"

order of components

draw on liquidity → manipulation → entry function

my personal draw on liquidity that I use, are smooth edges, these are equal highs or lows that price engineers

> the context behind this pattern is the liquidity price holds above this levels

how?

how to identify smooth edges

- > we're looking for a consolidation with equal highs
- > the first high must remain intact, so liquidity is still available
- > best when apart of the Asia range

Time

unmitigated

without first identifying draw on liquidity and establishing a level that you expect price to move towards

we ultimately have no trade, without strong framework I refuse to participate within the market

always start with where is price going.

The 09:30 Open

what is the 09:30 open?

- the 09:30 open is market open, however my interest is the judas macro that occurs

what contracts do I watch

- NQ nasdaq
- ES S&P500
- CL usoil

what are we looking for?

- a judas swing is a move in the opposing direction at open price
- first you need to have a draw on liquidity, where is price moving

Draw on Liquidity

- my draw on liquidity preference are equal highs and lows
- once I have a draw on liquidity I wait for the open price

the judas swing

- draw to the upside
judas to the downside
- draw to the downside
judas to the upside

Liquidity - price stop run

- it is necessary that judas swing runs liquidity
 - what does this mean?
- we want price to build significant liquidity, such as equal highs and lows

equal highs =

equal lows =

Search & Destroy Profile

WHAT IS IT

- a daily profile is a schematic that price consistently and commonly repeats
- there are many daily profiles, however we will be discussing the search & destroy
- having an expectation or idea of how price should move and what levels to watch provide an edge
- with this we can evaluate environments and dol's before session has even started
- the search and destroy profile is an environment that we do not like to trade
- most usually the primary focus of this day is to run stop-losses, making it an undesirable day

SCHEMATIC

IDENTIFY

Asia range high & low is taken by the London session

London high and low is taken by the New York session

this results in the day gradually expanding to upside and downside

TIMES

Asia session
20:00 - 00:00

London session
02:00 - 05:00

New York session
07:00 - 12:00

[check the environment]

is price forming a search & destroy daily profile

is the current day inside-bar?

was there large expansion the previous day?

good environment

bad environment

[draw on liquidity]

identify the draw on liquidity, my personal
preference is equal highs & lows.

we do not trade bad
environments

remain flat

if we cannot identify smooth edges, we will
remain flat for the remainder of the day

valid draw on liquidity

no draw on liquidity

[manipulation]

our first component is draw
on liquidity, without this we
have no trade

once we have a draw on liquidity, we can expect
manipulation at the 09:30 open

this is a stop run in the opposing direction the
draw on liquidity

no manipulation

manipulation at 09:30

without manipulation
we have no trade

[entry function]

following manipulation we want price to shift
towards the draw on liquidity

where we look to enter at the
breaker + fvg

Trade Plan:

Higher timeframe PDA (Monthly / Weekly / Daily)

manage the risk
respect the plan
control your emotions
journal every trade
collect the data and work on it
refine your edge AKA improvement
rinse & repeat

the market rewards those who are patient and disciplined. not those in a hurry.

your life actually changes overnight
It just takes years to get to that night

Intermediate timeframe (4H / 1H)

Simple checklist

- ☒ HTF PDA - IRL → ERL / ERL → IRL
- ☒ Stop Hunt
- ☒ Unicorn Entry

Once you have a refined system its game over.
Nothing will change
Until you go to war with yourself.

Time

Liquidity

Economic Calendar

Economic calendar
HTF Draw on liquidity
Formation of a PD array towards your draw
Day of the week / Time of the day
Tag into a PD array within specific Killzone
Reversal or continuation session profile
M5 / M15 stages of the MMXM for entry

draw on liquidity
- smooth edges
- asia range
manipulation
- judas swing
entry function
- breaker+fvg

Lower timeframe (15M / 5M / 1M)

The unicorn is "one of the strongest Algorithmic entry patterns you can ever have"

1. Draw on liquidity
2. Manipulation
3. Breaker + FVG
