

Past plays same process

Same process.
Same model.
Different day.

Here's a look back at some recent trades, all using the same blueprint. This should give further insight into the actual execution of this model and the similarities that consistently show themselves in this market.

Blueprint:

1- Draw on liquidity

We target relative equal highs and lows, smooth edges, the Asia range liquidity is preferred for this.

2- Manipulation

A strong move at the 9:30 open, in the opposing direction to the draw on liquidity, to trap traders before reversing. The 9:30 Judas

3- Entry function

I look for a breaker aligned with a FVG or general displacement through the Judas open.

Past plays
same process

NQ May 27

Trade description: Equal highs, not from the Asia range but clean and defined, followed by strong manipulation and recovery. Easy confirmation once price reclaimed the Judas swing.

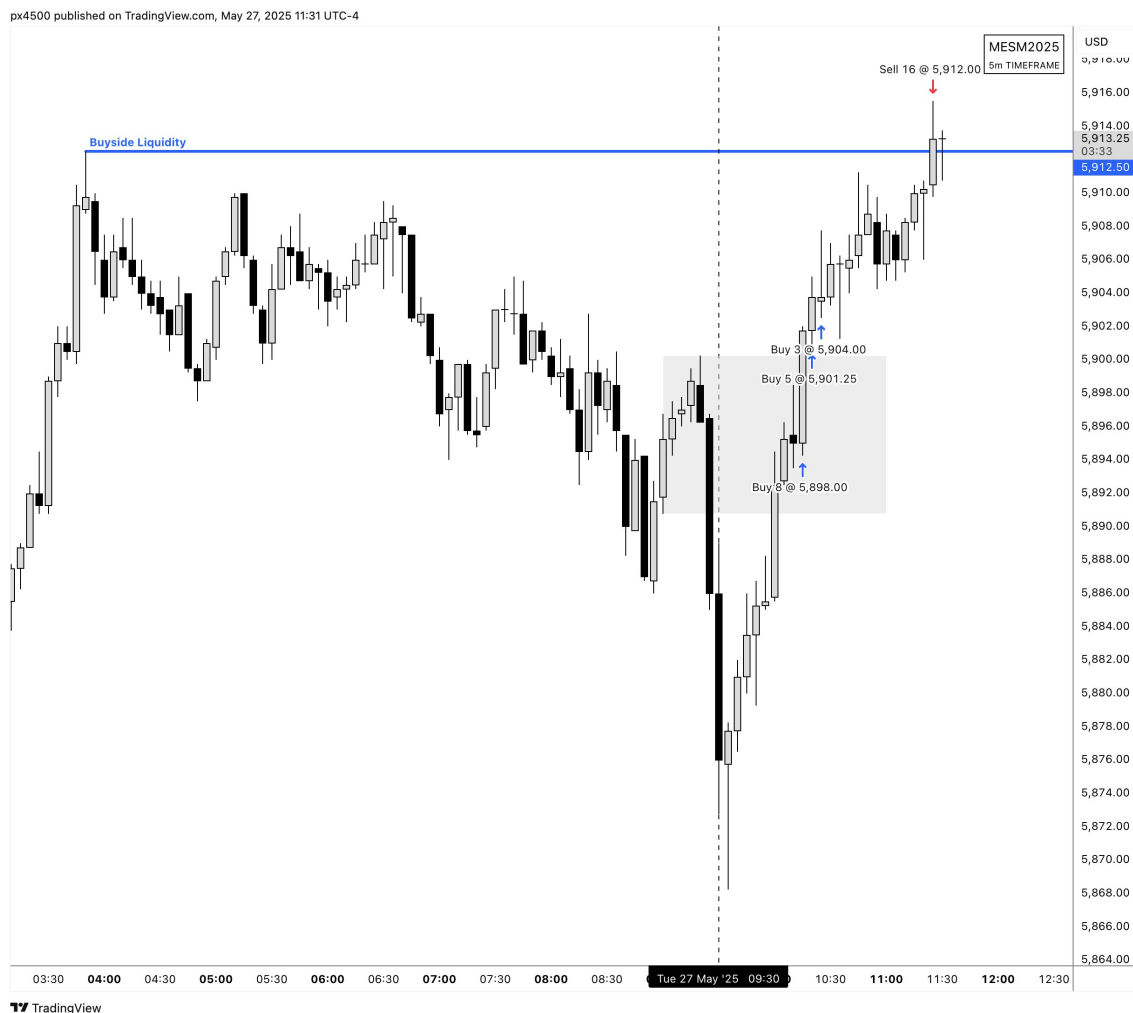

The consistent FVGs pressuring themselves moving through the breaker is a key detail

All 3 components are present

- Smooth edges
- Manipulation at 09:30
- Breaker + FVG

Can you see how a trade is only warranted after price has
a) moved the opposing direction at a specific time
b) then recovers that move

This means our entries are conditional. "This must happen before that"

NQ June 23

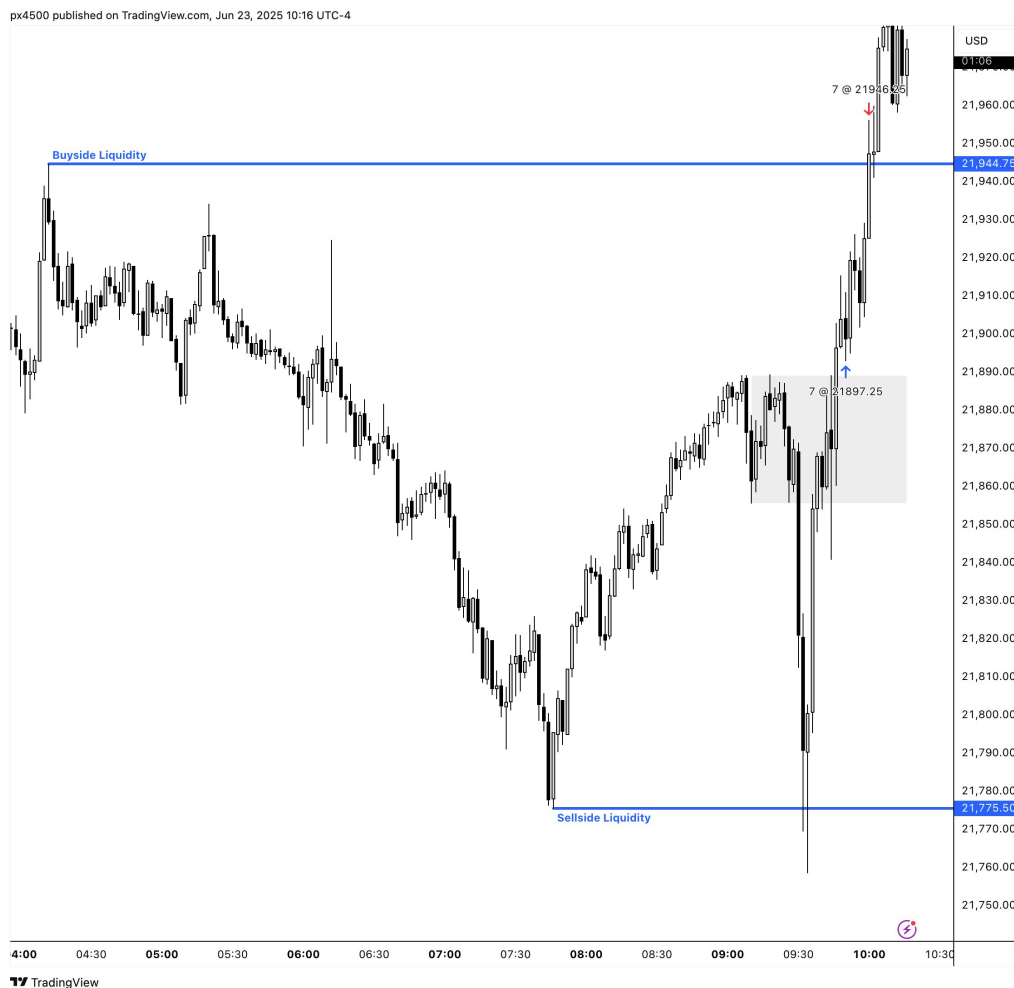

Trade description: Again, equal highs, not Asia range liquidity. But once price cleared the liquidity and recovered the manipulation, that was enough for a trade.

All 3 components are present

- Smooth edges
- Manipulation at 09:30
- Breaker + FVG

Once more, the trade is only taken after clear manipulation at 9:30, with price recovering the leg. A FVG then forms next to the breaker.

These days pop up constantly, the hard part is waiting not trading them.

NQ July II

Trade description: Another case where the draw on liquidity formed outside the Asia range, but still showed smooth edges. Strong manipulation hit the open price, was quickly recovered, then presented a breaker + FVG.

All 3 components are present

- Smooth edges
- Manipulation at 09:30
- Breaker + FVG

The key takeaway is that we're waiting for two conditions around the manipulation:

- a) price must clear liquidity in the opposite direction
- b) then recover that leg and displace above.

Final thoughts

These are clear conditional statements that must align for the model to be valid.

Manipulation is often misunderstood, it's the deliberate move against the intended direction before the real move takes place. This should clear any doubt that's hindering your progress.

Entering earlier, the turtle soup entry, might offer more profit, but it skips the confirmation of price reclaiming the manipulation. That comes with increased risk.

There is no single right way, but I prefer confirmation. Smaller, consistent wins add up, and that's how you build longevity.
