2024

INTRODUCTION

This document serves the purpose of compiling a selection of trade examples that were observed and analyzed during the month of January 2024. It is essential to clarify that these examples, while showcasing the model's trading capabilities, do not represent an exhaustive account of all potential opportunities encountered by the model throughout the month. The intent is to offer a snapshot of the model's performance and its adaptability across various currency pairs, timeframes, and trading sessions.

Within this document, we will explore specific trade scenarios, shedding light on the model's decision-making processes, and overall effectiveness in responding to diverse market conditions. While January provides a focal point for this compilation, it's crucial to acknowledge that the model's trading activities are ongoing, making this document valuable for historical analysis and continuous performance assessment.

Whether you are interested in historical insights or assessing the model's real-time capabilities, this compilation of trade examples from January offers a balanced perspective on the model's performance.

THE MODEL SIMPLIFIED

The model itself is deliberately simple, with a primary focus on a few critical variables.

First and foremost is our draw, which, in my opinion, stands as the most crucial factor for the success of a trade idea. Having a clear understanding of where the price is most likely to go is paramount because it significantly simplifies the entire trading process. In my view, 'Smooth Edges' are the most effective means to determine the likely direction of price movement in the hunt for liquidity.

The second key variable is time. We utilize session open times to identify potential manipulation moves that may run counter to our draw. Ideally, we aim to observe price movement in the opposite direction, either at or slightly after the market's opening. This setup allows us to anticipate and position ourselves for a subsequent move in the direction we desire.

The third component revolves around our entry strategy, which, in this case, is the unicorn. This entry function essentially consists of a breaker aligned with a fair value gap. While this component is important, it holds a relatively lower priority for me. Missing this particular entry opportunity is not a significant concern since I have confidence that the price will eventually align with our draw. In such cases, we can always seek alternative entry points to position ourselves as price progresses towards our draw.

DATA INDEX

ID	TRADE	SESSION	PAGE
001	CL LONG - 05.02.2024	NY AM	PAGE 4
002	ES LONG - 08.02.2024	NY AM	PAGE 5
003	NQ LONG - 13.02.2024	NY AM	PAGE 6
004	CL SHORT - 14.02.2024	NY AM	PAGE 7
005	NQ LONG - 14.02.2024	LUNCH SESSION	PAGE 8
006	NQ LONG - 21.02.2024	NY AM	PAGE 9

DATE	05/02/2024
PAIR	CL
SESSION	NEW YORK AM
COMPONENTS	[1] EQUAL HIGHS [BUY SIDE LIQUIDITY] [2] LIQUIDITY TAKEN [10:00 NEWS DRIVER] [3] BREAKER + DISPLACEMENT + FVG

In this first trade, we had [1] Equal Highs on the buy-side liquidity as our draw for the trade.

We had to wait until 10:00 a.m. for the news release, and we had our [2] manipulation with the news release.

On the lower timeframe, we can clearly see how liquidity is manufactured with the purpose to then be raided and go up.

Lastly, he had our entry function [3] Breaker + Fair Value Gap, but the entry would have been a market entry since we didn't have a pullback into the breaker.

[15 MINUTE CHART]

DATE	08/02/2024
PAIR	ES
SESSION	NEW YORK AM
COMPONENTS	[1] SMOOTH EDGES [2] PRICE MANIPULATION [8:30 NEWS DRIVER] [3] BREAKER + DISPLACEMENT + FVG

We have Smooth Edges as our draw on liquidity, to start working with the framework,

We had a news driver at 8:30, so any manipulation within the news driver could be considered manipulation. Furthermore, we had our manipulation with the 8:30 news driver, as expected.

After that, we got our breaker + FVG as entry function to position ourselves.

The price action was choppy, but it delivered to our draw in the end.

[5 MINUTE CHART]

DATE	13/02/2024
PAIR	NQ
SESSION	NEW YORK AM
COMPONENTS	[1] HTF FVG AS DRAW [2] 1H HTF POINT OF INTEREST SWEEP [2] PRICE MANIPULATION AT OPEN [9:30 OPEN] [3] BREAKER + DISPLACEMENT + FVG

In this example, we did not start with our Smooth Edges; instead, we targeted a m15 fair value gap as our draw on liquidity.

In this case, as we said, we didn't have smooth edges, but we had a high timeframe point of interest sweep to add more confluence to the trade idea.

We got our price manipulation at session open 9:30.

Lastly, we had our breaker + FVG as entry function.

DATE	14/02/2024
PAIR	CL
SESSION	NEW YORK AM
COMPONENTS	[1] SMOOTH EDGES [ASIA RANGE] [2] LIQUIDITY TAKEN AT OPEN [9:30 MARKET OPEN] [3] BREAKER + DISPLACEMENT + FVG

Asia range lows (smooth edges) as draw on liquidity to start framing our trade idea.

In this case, we are trading Crude Oil, In my opinion, in CL we should closely look for 9:00 commodities open and 9:30 indices open, in order to spot any sort of manipulation. We had our manipulation move at 9:30.

Then we had displacement through a breaker with a FVG to try to position ourselves into a short position.

[15 MINUTE CHART]

DATE	14/02/2024
PAIR	NQ
SESSION	LUNCH SESSION
COMPONENTS	[1] BUY SIDE LIQUIDITY [2] PRICE MANIPULATION [12:00 LUNCH SESSION OPEN] [3] BREAKER + DISPLACEMENT + FVG

I don't usually trade or watch lunch session, but in this case, we had [2] clear manipulation at session open.

Once the manipulation was spotted, the [1] clear draw was the buy-side liquidity in case we had our entry function.

After the manipulation, the price displaced through the breaker, leaving a FVG for us to enter, confirming the possible long trade idea.

This is not a trade I would look for or trade regularly, as I try to aim for smooth edges as my draw on liquidity.

———— [5 MINUTE CHART]

DATE	21/02/2024
PAIR	NQ
SESSION	NEW YORK AM
COMPONENTS	[1] BUY SIDE LIQUIDITY [2] LIQUIDITY TAKEN AT OPEN [9:30 MARKET OPEN] [3] BREAKER + DISPLACEMENT + FVG

Another example is where we start without smooth edges; instead, for this framework, we aimed for buy-side liquidity.

We had 9:30 open session manipulation to the downside.

And as always, our entry function showed up as we displaced through the breaker with an aligned fair value gap for us to enter a long position.
